

A Global Digital Payment Network for Humans and AI Agents

Traditional Finance × On-Chain Infrastructure × Payment Layer for the AI Era

The Global Digital Payment Network for Humans and AI Agents

ENIPAY is the first global digital payment network built on the ENI public chain, designed for both human users and AI Agents — integrating stablecoin accounts, real-world payments, and AI autonomous payment channels into one.

Whether you are making a purchase or an AI is acting on your behalf, ENIPAY serves as the underlying payment infrastructure.

ENIPAY Payment Application

01

PART ONE

ENIPAY Ecosystem Background

Payment is no longer just a transfer tool, but the foundational entry point of the future digital economy

- The current global payment system is at a critical stage of transformation from a “traditional financial network” to a “digital value network.”
- On one hand, traditional payment systems rely on banking clearing networks, which suffer from low cross-border efficiency, high costs, and long settlement cycles. Cross-border payments still take 1–3 days on average, with fees as high as 3%–7%, making it difficult to support a real-time global economy.
- On the other hand, the rise of Web3 and digital assets is changing how value flows. Stablecoin settlement volume has exceeded trillions of dollars. On-chain payments offer 24/7 availability, low cost, and programmable settlement, but still lack infrastructure that truly connects to real-world consumption scenarios.

Traditional Payments: Have scenarios, but low efficiency

Crypto Payments: Efficient, but lack real-world applications

User Assets: Can be held, but difficult to use

Whoever can connect “on-chain assets + real-world consumption + global circulation” will control the next generation of financial infrastructure

Existing payment networks lack native support for AI Agents

Payments Were Built for Humans — Not for Agents

Traditional payments are only suitable for human operation

- Depend on manual initiation, confirmation, and authorization
- Suitable for one-time consumption, not continuous task execution
- Lack native payment mechanisms for Agents

Crypto payments enable asset transfer, but not real-world consumption

- Better at transfers, holding, and on-chain settlement
- Weak connection with offline merchants and daily consumption scenarios
- Lack stable and controllable real-world payment capabilities

AI Agents can execute tasks, but cannot truly pay

- No independent and controllable payment identity
- Lack permission, limits, and responsibility boundaries
- Cannot reliably access real-world payment networks

ENI × Payment = An Inevitable Web3 Trend

The true value of a public chain does not lie in TPS or technical parameters, but in whether it can build real usage scenarios and a value closed loop. Currently, most public chains remain at the “trading and speculation layer,” lacking sustainable cash flow and real demand support.

ENI chooses payment as the core entry point to build ENIPAY, based on three key judgments:

1. Payment is the strongest demand scenario

Payment is the only application that covers all users, all industries, and all regions, serving as the core bridge connecting on-chain assets and the real world.

2. Stablecoins will become next-generation currency

As stablecoins continue to grow, they are becoming new infrastructure for cross-border trade, consumer payments, and fund settlement — not just crypto assets.

3. Public Chain + Payment = Value Closed Loop

When a public chain gains payment capabilities, assets evolve from “tradable” to “usable,” forming: Asset issuance → circulation → usage → value accumulation → ecosystem growth

02

PART TWO

ENI Chain Ecosystem Introduction

What is the ENI Public Chain?

ENI is a high-performance, enterprise-grade modular Layer 1 blockchain specifically designed for large-scale commercial scenarios, with the capability of unlimited TPS processing.

Ultra-High Performance

- Supports unlimited TPS concurrent transactions,
- ensuring real-time parallel settlement for global large-scale commercial activities

Seamless On-Chain Integration

- No changes to existing processes or system logic,
- enabling smooth and seamless migration of real-world business

Modular Design

- Flexible architecture that adapts to various needs,
- allowing enterprises to rapidly customize dedicated Web3 solutions

One-Click Chain Deployment

- Supports minute-level "one-click chain deployment" based on business and jurisdiction requirements,
- with built-in enterprise governance systems to ensure compliance and scalability

At its core, ENI adopts the "Mainnet + Hub + AppChain" ENI Matrix architecture, powered by a hyper-asynchronous parallel computing engine. It enables enterprises to deploy customizable and scalable AppChains under a unified governance framework, supporting global on-chain parallel operations and real-time settlement.

ENI Matrix is built on a federated structure of “Mainnet + Hub + AppChain,” forming an enterprise-grade blockchain matrix where “assets flow freely, risks are controllable, and performance scales infinitely,” enabling reliable, fast, and compliant multi-chain business collaboration at scale.

Elastic & Scalable Architecture

[Mainnet + Hub Chain + Business Chain (AppChain)] federated layered cluster architecture

- Deep parallelization across enterprise-level multi-business lines
- Independent business chains isolate cross-interference
- Unified architecture collaboration with unlimited scalability
- Adaptable to diversified large-scale business deployments

Atomic Cross-Chain Technology

Parallel cross-chain communication protocol with atomic validators, enabling “atomic commitment” of cross-chain transactions

- Ensures security of enterprise multi-chain fund operations
- Delivers ultra-smooth experience for high-frequency complex transactions
- Balances data security and collaboration

Flexible On-Demand Deployment

AppChains can be deployed on demand, with dedicated business chains launched within minutes

- Minute-level chain deployment enables agile business response
- Dual-layer isolation balances compliance and efficiency
- Interconnected AppChain clusters create ecosystem scale effects

Performance Peak: Infinite scalability supporting ultra-high commercial throughput

PMT Storage Optimization

Eliminates stability and responsiveness bottlenecks under extreme load

Hyper-Parallel Computing Engine

Intelligent scheduling supporting large-scale parallel business execution

Quantum-Level Blockchain Architecture

Forward-looking architecture ensuring secure circulation of institutional assets

Ultra-High Performance Modular Design

Supports unlimited horizontal scaling, achieving unlimited TPS performance

ENI

20,000+: Single-chain TPS throughput

-85%: Significant reduction in transaction latency

Infinite scalability: Elastic network-wide throughput

Millisecond-level response & high concurrency

- Blockchain infrastructure capable of handling Web2-level traffic
- Supports real-time parallel settlement for global large-scale commerce
- No trade-off between decentralization and performance

Arion Ho
Founder & CEO

Arion Ho has over 20 years of leadership experience across top-tier financial institutions (HKEX, UBS, Standard Chartered Bank) and regulated digital asset sectors (OSL Hong Kong, Zodia Markets under Standard Chartered). He completed advanced executive programs at MIT Sloan School of Management, integrating world-class academic insights with extensive global operational experience.

With decades of multinational team management experience (China, Hong Kong, UK, Singapore), he possesses deep expertise in global financial compliance (Hong Kong SFC / UK FCA) and risk control standards. He has outstanding experience in risk management, liquidity management, and cross-border business expansion. By combining strong regulatory expertise with cutting-edge blockchain technology, he is committed to building the next generation of financial infrastructure.

PART THREE

ENIPAY Ecosystem Introduction

A Global Payment Aggregation Platform Built on the ENI Public Chain

- Initiated by the ENI public chain with global leading institutions, ENIPAY is a next-generation digital payment platform built on blockchain infrastructure and financial-grade settlement systems.
- It serves both human users and AI Agents, enabling a new economy where machines can transact and pay.
- ENIPAY integrates a dedicated DAPP ecosystem, where ENI functions as the core settlement asset, continuously capturing value and distributing rewards.
- As real-world adoption expands, the ecosystem value will scale further, with EPAY to be introduced to complete the full payment value loop.

ENIPAY is designed for retail users, building a dual-engine system of "Payment + Finance", enabling a complete lifecycle loop of digital assets: One entry is for spending, one entry is for earning

ENIPAY APP: Global Payment & Spending Entry

- Supports virtual cards / physical U cards (Visa / Mastercard)
- Stablecoin balances can be directly used for global payments and consumption
- Covers online shopping, offline card payments, QR payments, and more
- Bridges digital assets with real-world consumption scenarios

Transforms crypto assets from "visible" to "usable"

ENIPAY DAPP: On-Chain Finance & Yield Entry

- Supports stablecoin staking and yield generation
- Builds on-chain financial products and liquidity systems
- Enables automated asset operation and yield distribution
- Provides transparent and verifiable on-chain return mechanisms

Transforms crypto assets from "holding" to "growing"

Consumption generates traffic → Finance accumulates capital → Capital feeds back into the ecosystem → Ecosystem drives growth

Traditional Finance × On-Chain Infrastructure × AI-Era Payment Layer

True Stablecoin Operating Account

More than a wallet. A complete account system with ledger management, permission control, and risk management — designed for long-term personal and enterprise operations.

Crypto Payment Ecosystem Platform

Built-in mini-app engine covering flights / hotels / shopping / wealth management / DeFi — all in one place without leaving the App, directly using account assets for payment.

QR Payments + Global U Card Spending

Covers QR payments across five Southeast Asian countries. Apply for virtual or physical U cards (Visa / Mastercard) and spend stablecoin balances globally in any scenario.

Compliance First, Security First

Three-layer KYC/KYB · AML screening · MPC wallet · hot & cold wallet separation

AI Agent Dual Payment Channels

ENIPAY provides independent payment identity for AI Agents

X402 Protocol

For token purchases, API calls, and micro autonomous settlements — executed fully on-chain

Agent Dedicated Credit Card

For purchasing real-world goods on behalf of users, enabling true identity-bound consumption

ENIPAY DAPP is an on-chain financial system built on the ENI public chain (compatible with BSC), providing users with a one-stop entry for stable returns + asset growth + ecosystem participation

User Value

Earn stable yields

Receive ENI ecosystem token incentives

Participate in long-term platform growth dividends

Supports stablecoins in on-chain strategies for continuous yield

Fully on-chain execution — transparent, secure, and verifiable

Diversified financial strategies to improve capital efficiency

Flexible participation and asset allocation at any time

ENIPAY Dual-Token System

Core token of ENI public chain: ENI TOKEN

Initial listing price: 20 USDT

“ EPAY Automatic Reserve Token

EPAY adopts a one-way circulation mechanism (sell-only, no buyback), reinforcing deflation and value support at the structural level.

Allocation Structure

80% Liquidity Pool → Blackhole Lock (permanent burn)

10% Community Development

5% Deposit Airdrop

5% Foundation (ecosystem development)

Total Supply: 100 million EPAY

ENI will officially launch on September 20, 2026,
with initial listings on 45 major global exchanges including Binance,
OKX, Gate, Bybit, Coinbase, Bitget, HTX, MEXC, and KuCoin.

Payment-Driven Revenue

Real profits continuously generated from global payment scenarios
Building a stable source of income

Profit Released in Advance

Future earnings distributed in advance
Participation enters continuous rebate cycles

Continuous Rebate Mechanism

Periodic yield distribution
Creates a stable cash flow experience

Early ENI Bonus

Acquire ENI before listing
Capture early-stage growth of the public chain

Dual Value

Yield returns + asset appreciation
Enhances overall certainty

ENIPAY Partners

Security Architecture

Three-layer KYC/KYB

AML Screening

MPC Wallet

Hot & Cold Wallet
Separation

Compliance Framework

Canada MSB License (FINTRAC registered), compliant for cross-border remittance and currency exchange

Bridge Account Authorization — integrated with virtual banking systems, enabling direct transfers between same-name accounts

Binance Account Authorization — institutional-grade security via Binance custody wallet system

04

PART FOUR

ENIPAY Payment Application

ENIPAY Payment App

- The ENIPAY CARD App is a global digital asset payment platform designed for users worldwide, integrating stablecoin accounts, global consumption, and on-chain settlement into one unified system.
- Users can apply for virtual or physical U Cards (Visa / Mastercard) to complete online payments, offline purchases, and QR code transactions globally—bridging digital assets with real-world usage seamlessly.
- Powered by the ENI public chain infrastructure, the platform delivers high-efficiency, secure, and low-cost settlement, enabling assets to be truly usable, transferable, and continuously value-accruing.

**Stablecoin
Accounts**

**Web3 Asset
Accounts**

**Trading
Accounts**

Global Payments, Seamless Experience

Supports both human and AI Agent card payments

VISA

Card Payment

- U Card application with borderless payment experience
- Dual issuance modes:
Virtual Card (instant activation)
Physical Card (ATM withdrawal supported)
- Fund binding: directly spend from stablecoin balance
- Agent-specific cards available

QR Pay

Use the ENIPAY App to scan and pay.
ENIPAY handles routing, currency
exchange processing, and merchant
settlement.

Merchants

QR Payment Network

ENIPAY QR payment network is expected to cover 160 countries, supporting both static and dynamic QR codes—making crypto payments as seamless as fiat payments

Supports over 10,000 merchants, including but not limited to:

Nearly 40 banking apps and a wide range of mainstream merchants

ENIPAY Ecosystem Expansion

Built-in mini-program engine

No need to leave the App—pay directly using your account assets

Flights / Hotels / Shopping / Wealth Management / DeFi

All-in-one access

Ecosystem Platforms

Retail, shopping, and gift cards

Online Subscriptions

Cross-border digital services and online consumption

Covers the full lifecycle of funds: from collection to disbursement

■ White-label issuing — card issuance for partner platforms

■ Supply chain finance — liquidity support based on payment flows

ENIPAY Comparison

Category	Traditional Card	Single Payment App	ENIPAY
Core Product	Card-based consumption	Payment tool	Global payment network for humans & AI Agents
Fund Nature	Pass-through funds	Pass-through funds	Retained & circulating capital
Real-world Payment	Card networks	Usually limited	QR systems + card network + mini-program ecosystem
Agent Capability	None	None	Native Agent payment (Agent Card + X402)
Payment Network	Card network	Single-point payment	Crypto payment ecosystem + AI payment infrastructure
Infrastructure & Credibility	Dependent on issuers	Limited capability	Licensed + settlement infrastructure (Visa Principal Member / Visa Direct APAC pilot)
